.NET 9 App Dev Hands-On Lab

Razor Pages Lab 3 –Pipeline Configuration, Dependency Injection

This lab configures the HTTP pipeline and configures the configuration and dependency injection. Before starting this lab, you must have completed Razor Pages Lab 2b.

Part 1: Configure the Application

Step 1: Update the Development App Settings

- Update the `appsettings.Development.json` in the `AutoLot.Web` project to the following (adjusted for your connection string and ports):
  Note the comma added after `"AutoLot.Web - Dev"`

```
{
  "AppLoggingSettings": {
    "MSSqlServer": {
      "TableName": "SeriLogs",
      "Schema": "Logging",
      "ConnectionStringName": "AutoLot"
    },
    "File": {
      "Drive": "c",
      "FilePath": "temp",
      "FileName": "log_AutoLot_Debug.txt"
    },
    "General": {
      "RestrictedToMinimumLevel": "Information"
    }
  },
  "AppName": "AutoLot.Web - Dev",
  "RebuildDataBase": true,
  "ConnectionStrings": {
    //SQL Server Local Db
    "AutoLot": "Server=(localdb)\\MSSQLLocalDB;Database=AutoLot_Hol;Trusted_Connection=True;"
    //"AutoLot": "Server=(localdb)\\ProjectModels;Database=AutoLot_Hol;Trusted_Connection=True;"
    //Docker
    //"AutoLot": "Server=.,5433;Database=AutoLot_Hol;User ID=sa;Password=P@ssw0rd;"
  },
  "DealerInfo": {
    "DealerName": "Skimedic's Used Cars Development Site",
    "City": "West Chester",
    "State": "Ohio"
  }
}
```

Step 2: Add the Staging Settings File

- Add a new file named `appsettings.Staging.json` to the root of the `AutoLot.Web` project and update it to the following:

```
{
  "AppLoggingSettings": {
    "MSSqlServer": {
      "TableName": "SeriLogs",
      "Schema": "Logging",
      "ConnectionStringName": "AutoLot"
    },
    "File": {
      "Drive": "c",
      "FilePath": "temp",
      "FileName": "log_AutoLot_Staging.txt"
    },
    "General": {
      "RestrictedToMinimumLevel": "Information"
    }
  },
  "AppName": "AutoLot.Web - Staging",
  "RebuildDataBase": false,
  "ConnectionStrings": {
    //SQL Server Local Db
    "AutoLot": "Server=(localdb)\\MSSQLLocalDB;Database=AutoLot_Hol;Trusted_Connection=True;"
    //"AutoLot": "Server=(localdb)\\ProjectModels;Database=AutoLot_Hol;Trusted_Connection=True;"
    //Docker
    //"AutoLot": "Server=.,5433;Database=AutoLot_Hol;User ID=sa;Password=P@ssw0rd;"
  },
  "DealerInfo": {
    "DealerName": "Skimedic's Used Cars Staging Site",
    "City": "West Chester",
    "State": "Ohio"
  }
}
```

Step 3: Update the AppSettings.json file

- Update the `appsettings.json` in the `AutoLot.Web` project to the following:
  Note the added comma after "*"

```
{
  "AllowedHosts": "*",
  "DealerInfo": {
    "DealerName": "Skimedic's Used Cars",
    "City": "West Chester",
    "State": "Ohio"
  }
}
```

Step 4: Update the Production Settings File

- Update the `appsettings.Production.json` in the `AutoLot.Web` project to the following: Note the comma added after `"AutoLot.Web"`

```json
{
  "AppLoggingSettings": {
    "MSSqlServer": {
      "TableName": "SeriLogs",
      "Schema": "Logging",
      "ConnectionStringName": "AutoLot"
    },
    "File": {
      "Drive": "c",
      "FilePath": "temp",
      "FileName": "log_AutoLot.txt"
    },
    "General": {
      "RestrictedToMinimumLevel": "Error"
    }
  },
  "AppName": "AutoLot.Web",
  "RebuildDataBase": false,
  "ConnectionStrings": {
    "AutoLot": "[its-a-secret]"
  }
}
```

Part 2: Add the GlobalUsings.cs File

- Create a new file named `GlobalUsings.cs` in the `AutoLot.Web` project and update the contents to the following:

```csharp
global using AutoLot.Dal.EfStructures;
global using AutoLot.Dal.Initialization;
global using AutoLot.Dal.Repos;
global using AutoLot.Dal.Repos.Interfaces;
global using AutoLot.Services.Logging.Configuration;
global using AutoLot.Services.Logging.Interfaces;
global using AutoLot.Services.Simple;
global using AutoLot.Services.Simple.Interfaces;
global using AutoLot.Services.Utilities;
global using AutoLot.Services.ViewModels;
global using Microsoft.AspNetCore.Http.Features;
global using Microsoft.AspNetCore.Mvc;
global using Microsoft.AspNetCore.Mvc.Infrastructure;
global using Microsoft.AspNetCore.Mvc.RazorPages;
global using Microsoft.EntityFrameworkCore;
global using Microsoft.EntityFrameworkCore.Diagnostics;
global using Microsoft.Extensions.DependencyInjection.Extensions;
global using Microsoft.Extensions.Options;
global using System.Diagnostics;
global using System.Text.Json.Serialization;
```

Part 3: Update the Program.cs Top Level Statements

Step 1: Add Logging

- Add `Serilog` to the `WebApplicationBuilder` and the logging interfaces to the DI container in `Program.cs` in the `AutoLot.Web` project:

```
var builder = WebApplication.CreateBuilder(args);
builder.ConfigureSerilog();
builder.Services.RegisterLoggingInterfaces();
```

Step 2: Update WebHost for CSS Isolation

- The CSS Isolation file is created in the development environment or when an app is published. To create the CSS file in other environments, update the web host to use static web assets:

```
builder.Services.RegisterLoggingInterfaces();
if (!builder.Environment.IsDevelopment())
{
  builder.WebHost.UseStaticWebAssets();
}
```

Step 3: Add Application Services to the Dependency Injection Container

- Add the repos to the DI container after the comment *//Add services to the container* and after the call to `AddRazorPages()`:

```
//Add services to the DI container
builder.Services.AddRazorPages();
builder.Services.AddScoped<ICarDriverRepo, CarDriverRepo>();
builder.Services.AddScoped<ICarRepo, CarRepo>();
builder.Services.AddScoped<IDriverRepo, DriverRepo>();
builder.Services.AddScoped<IMakeRepo, MakeRepo>();
builder.Services.AddScoped<IRadioRepo, RadioRepo>();
```

- Add the keyed services into the DI container:

```
builder.Services.AddKeyedScoped<ISimpleService, SimpleServiceOne>(nameof(SimpleServiceOne));
builder.Services.AddKeyedScoped<ISimpleService, SimpleServiceTwo>(nameof(SimpleServiceTwo));
```

- Add the following code to populate the `DealerInfo` class from the configuration file:

```
builder.Services.Configure<DealerInfo>(builder.Configuration.GetSection(nameof(DealerInfo)));
```

- Add the `IActionContextAccessor` and `HttpContextAccessor`:

```
builder.Services.TryAddSingleton<IActionContextAccessor, ActionContextAccessor>();
builder.Services.AddHttpContextAccessor();
```

- Add the `ApplicationDbContext`:

```
var connectionString = builder.Configuration.GetConnectionString("AutoLot");
builder.Services.AddDbContextPool<ApplicationDbContext>(
  options =>
  {
    options.ConfigureWarnings(wc => wc.Ignore(RelationalEventId.BoolWithDefaultWarning));
    options.UseSqlServer(connectionString,
      sqlOptions => sqlOptions.EnableRetryOnFailure().CommandTimeout(60));
  });
```

Step 4: Add DI Validation

- Add the code to validate DI services and scopes on building the web app:

```
builder.Services.AddRazorPages()
  .AddControllersAsServices()
  .AddViewComponentsAsServices()
  .AddTagHelpersAsServices();

builder.Host.UseDefaultServiceProvider(o =>
{
  o.ValidateOnBuild = true;
  o.ValidateScopes = true;
});
```

Step 5: Add JSON Configuration

- Add the code to configure JSON handling:

```
builder.Services.AddRazorPages()
  .AddJsonOptions(options =>
  {
    options.JsonSerializerOptions.PropertyNamingPolicy = null;
    options.JsonSerializerOptions.PropertyNameCaseInsensitive = true;
    options.JsonSerializerOptions.WriteIndented = true;
    options.JsonSerializerOptions.ReferenceHandler = ReferenceHandler.IgnoreCycles;
  })
  .AddControllersAsServices()
 // rest omitted for brevity
```

Step 6: Call the Data Initializer and Update the Project File

- In the section after `builder.Build()`, flip the `IsDevelopment` if block around, and add the `UseDeveloperExceptionPage` so the code looks like this:

```
// Configure the HTTP request pipeline.
if (app.Environment.IsDevelopment())
{
}
else
{
  app.UseExceptionHandler("/Error");
  // The default HSTS value is 30 days.
  // You may want to change this for production scenarios, see https://aka.ms/aspnetcore-hsts.
  app.UseHsts();
}
```

- In the `IsDevelopment` if block, check the settings to determine if the database should be rebuilt, and it yes, call the data initializer:

```
if (app.Environment.IsDevelopment())
{
  app.UseDeveloperExceptionPage();
  if (app.Configuration.GetValue<bool>("RebuildDataBase"))
  {
    using var scope = app.Services.CreateScope();
    var dbContext = scope.ServiceProvider.GetRequiredService<ApplicationDbContext>();
    SampleDataInitializer.ClearAndReseedDatabase(dbContext);
  }
}
else
{
  app.UseExceptionHandler("/Error");
  // The default HSTS value is 30 days.
  // You may want to change this for production scenarios, see https://aka.ms/aspnetcore-hsts.
  app.UseHsts();
}
```

Part 4: Add WebOptimizer

This section shows how to use `WebOptimizer` for bundling, minification, and caching. The `MapStaticFiles` method (introduced in ASP.NET Core 9) and `WebOptimizer` do not work together yet, so it must be commented out.

Step 1: Add WebOptimizer to DI Container

- Update the `Program.cs` top-level statements by adding the following code after adding the services but before the `WebApplication` is built:

```
if (builder.Environment.IsDevelopment() || builder.Environment.IsEnvironment("Local"))
{
  builder.Services.AddWebOptimizer(false,false);
}
else
{
  builder.Services.AddWebOptimizer(options =>
  {
    //options.MinifyCssFiles(); //Minifies all CSS files
    options.MinifyCssFiles("css/**/*.css");
    //options.MinifyJsFiles(); //Minifies all JS files
    options.MinifyJsFiles("js/site.js");
    //options.MinifyJsFiles("js/**/*.js");
  });
}
var app = builder.Build();
```

Step 2: Add UseStaticFiles to the HTTP Pipeline

- Add in the call to `UseStaticFiles` and comment out the `MapStaticAssets` code in `Program.cs` as shown here:

```
app.UseHttpsRedirection();
app.UseStaticFiles();
app.UseRouting();
app.UseAuthorization();
//app.MapStaticAssets();
app.MapRazorPages();
//app.MapRazorPages()
//    .WithStaticAssets();
```

Step 3: Add WebOptimizer to the HTTP Pipeline

- Update the `Configure` method by adding the following code (**before** `app.UseStaticFiles()`):

```
app.UseWebOptimizer();
app.UseHttpsRedirection();
app.UseStaticFiles();
```

Step 4: Update _ViewImports to enable WebOptimizer Tag Helpers

- Update the `_ViewImports.cshtml` file to enable `WebOptimizer` tag helpers:

```
@using AutoLot.Web
@addTagHelper *, Microsoft.AspNetCore.Mvc.TagHelpers
@addTagHelper *, WebOptimizer.Core
```

Part 5: Update the Index.cshtml Page Code-Behind

- Replace the default `ILogger` with the `IAppLogging` and convert the constructor to a primary constructor in `Index.cshtml.cs` and update the `OnGet` method to log an error:

```
public class IndexModel(IAppLogging<IndexModel> logger) : PageModel
{
  public void OnGet()
  {
    logger.LogAppError("Test Error");
  }
}
```

- Run the application and launch a browser. Since the Index page is the application's default entry point, just running the app should create an error file and an entry in the `SeriLog` table.

- Once you have confirmed that logging works, comment out the error logging code:

```
//logger.LogAppError("Test error");
```

- Inject the `DealerInfo` `OptionsMonitor` into the primary `Constructor`, add a public `DealerInfo` property, and set the value in the constructor:

```
public class IndexModel(IAppLogging<IndexModel> logger,
 IOptionsMonitor<DealerInfo> dealerOptionsMonitor) : PageModel
{
  [BindProperty]
  public DealerInfo Entity { get; } = dealerOptionsMonitor.CurrentValue;

  public void OnGet()
  {
    //logger.LogAppError("Test Error");
  }
}
```

- Replace the HTML in `Index.cshtml` with the following (leave the `@page` directive and the Razor code block):

```
@page
@model IndexModel
@{
    ViewData["Title"] = "Home page";
}
<div class="text-center">
  <h1 class="display-4">Welcome to @Model.Entity.DealerName</h1>
  <p class="lead">Located in @Model.Entity.City, @Model.Entity.State</p>
</div>
```

Summary

This lab added the necessary classes into the DI container and modified the application configuration.

Next steps

In the next part of this tutorial series, you will add support for client-side libraries, update the layout, and add GDPR Support.
